A,Description: minor component of wild-type curli, interaction between CsgA and CsgB tr A,Note: curli are thin, coiled fibers expressed on the surface of Escherichia coli that and H-kintingeni, in the absence of CsgA, CsgB can self-assemble into polymers
F;1-21/Domain: signal sequence #status predicted <SIG>F;22-151/Product: minor curlin chain #status predicted <MAT>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              C;Species: Escherichia coli

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Curlin nucleator protein csgB precursor - Escherichia coli (strain K-12)

Nalternate names: csgB protein; curlin nucleation component; minor curlin protein
C;Species: Escherichia coli
C;Date: 12-Feb-1998 #sequence_revision 20-Feb-1998 #text_change 01-Mar-2002
C;Accesion: 370789; F64846

IT he ovo gane of Drosophila encodes a zinc finger protein required for female germ line development.";

EMBO J. 10:2259-2266(1991).

LINE CELLS. PLAYS A ROLE IN GERM LINE SEX DETERMINATION.

-! FUNGTION: REQUIRED FOR SURVIVAL AND DIFFERENTIATION OF FEMALE GERM LINE SEX DETERMINATION.

-! SUBGELLULAR LOCATION: Nuclear (Potential).

-! SUBGELLULAR LOCATION: Nuclear (Potential).

-! SUBGELLULAR LOCATION: Nuclear (Potential).

-! DEVELOPMENTAL STAGE: FIRST APPRARS IN THE GERMARIUM AND ACCUMULATES IN NURSE CELLS DURING OCCENESTS. STORED IN THE EGG, BUT IN THE EMBRYOS EXCEPT FOR ITS CONTINUED PRESENCE IN THE GERM LINE PRECURSOR POLE CELLS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This SWISS-PROT entry is copyright. FUNCTION: May regulate vesicle trafficking and modulate the subcellular distribution of SLC2A4/GUT4-vesicles. Has PARP activity and can modify TRP1, and thereby contribute to the regulation of telomere length.

-.. CATALYTIC ACTIVITY: NAD(+) + {ADP-D-ribosyl} (N) -acceptor = nicotinamide + {ADP-D-ribosyl} (N) -acceptor = nicotinamide + {ADP-D-ribosyl} (N) -acceptor = nicotinamide + {ADP-D-ribosyl} (N) -acceptor = nicotinamide of telomeric TRF2. Interacts with the cytoplasmic domain of LNPEP/Otase with TYMS2. Interacts with the cytoplasmic domain of telomeric TRF1 via the ANK repeats.

-.. SUBCEDIULAR LOCATION: Cytoplasmic, associated with the Golgi and with juxtanuclear SLC2A4/GUT4-vesicles. A minor proportion is also found at nuclear pore complexes and around the pericentriclar matrix of mitotic centromeres. During interphase, a small fraction of TNNS is found in the nucleus, associated with TRF1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Isold=095271-2; Sequence=VSP 004538, VSP 004539;
Note=No experimental confirmation available;
ISSUE SPECIFICITY: Ubiquitous; highest levels in testis.
PTM: Upon insulin-stimulation; phosphorylated on serine residues by MARK kinases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      N

-!- FUNCTION: THE 32 kDa BETA PEPTIDE MAY SERVE AS A MEMBRANE ANCHOR (By similarity).
-!- SUBCELLULAR LOCATION: Cell wall. This bacterium is covered by a slayer with hexagonal symmetry.
-!- SIMILARITY: BELONGS TO THE RICKETTSIAE OMPA/OMPB FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

-!- PUNCTION: Essential component of nuclear pore complex.

-!- PUNCTION: Essential component of nuclear pore complex.

Nucleoporins may be involved in both binding and translocation of the proteins during nucleocytoplasmic transport.

-!- SUBCEDLIVIAR LOCATION: Nuclear pore complex.

-!- DOMAIN: Contains G-L-F-G repeats.

-!- SUMILARITY: Belongs to the GLFG family of nucleoporins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

Ride I., Drexler K., Eschbach M.L., Henning U.;
NDNA sequence of genes 38 encoding a receptor-recognizing protein of bacteriophages T2, K3 and of K3 host range mutants.";
J. Mol. Biol. 194:31-39(1987).
I. FUNCTION: Vg38 is at the tip of the long tail fibers and serves as the phage recognition site for the cellular receptor.
I. MISCELLANEOUS: THIS PHAGE USE OUTER MEMBRANE PROTEINS OMPF AND TTR AS RECEPTORS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Bacteriophage T2.

Turcturally distinct genes for the surface protease of Leishmania
T mexicana are developmentally regulated.",
Mol. Biochem. Parasitol. 57:31-46(1993).

I. PUNCTION: Has an integral role during the infection of macrophages
in the mammalian host.

C -!- FUNCTION: Preference for hydrophobic residues at Pl and
Inthe mammalian host.

-!- CATALYTIC ACTIVITY: Preference for hydrophobic residues at Pl and
C -!- CATALYTIC ACTIVITY: Preference for hydrophobic residues at Pl and
C -!- CATALYTIC ACTIVITY: Preference for hydrophobic residues at Pl and
C -!- CATALYTIC ACTIVITY: Preference for hydrophobic residues at Pl and
C -!- CATALYTIC ACTIVITY: Loc ion per subunit (By similarity).

-!- COFACTOR: Binds I zinc ion per subunit (By similarity).

-!- DEVELOPMENTAL STAGE: Expressed in both the promastigote and the
amastigote forms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This SWISS-PROT entry is copyright.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                "Conserved repetition in the ice nucleation gene inax from Xanthomonas campestris pv. translucens.";
Mol. Genet. 223:163-166(1990).
-!- FUNCTION: Ice nucleation proteins enable bacteria to nucleate crystallization in supercolled water. By similarity).
-!- SUBCELLULAR LOCATION: Outer membrane (By similarity).
-!- DOMAIN: CONTAINS 153 IMPERFECT REPEATS OF THE CONSENSUS OCTAPEPTIDE A-G-Y-G-S-T-L-T; FURTHER ON A 16-RESIDUB AND A REGIONAL 48-RESIDUB PRRIODICITY IS SUBERIMPOSED.
-!- MISCELLANGOUS: A STRUCTURAL MODEL IS SUGGESTED IN WHICH THE ICE NUCLEATION PROTEIN DISPLAYS A SYMMETRY RELATED TO THAT OF ICE.
-!- SIMILARITY: Belongs to the bacterial ice nucleation protein
                                                                                                                                                                                                                                                                                  (POTENTIAL).
